(54) Title: COAGULATION DETECTION

(57) Abstract: A coagulation detecting apparatus has a structure defining a container for a fluid, and containing particles for movement through the container under the influence of a magnetic field. A magnetic arrangement provides sequential magnetic fields to the container such as to cause the particles to move. A light source illuminates the container and a detector detects optical radiation of the light source after passing through the container, the detector being arranged for optically detecting at least one of presence of the particles at a predetermined location in the fluid and movement of the particles through a predetermined location in the fluid.
